## *Seed and Small Seeds Rate Charts*

for the 3P500, 3P500V & 3P600  
3-Point 5-Foot and 6-Foot Compact Drills

The following pages are to assist in the proper setting of seeding rates for the 5-foot (1.4 m) and 6-foot (1.8 m) compact drills. The rates indicated in the charts are approximate. To assure the most accurate seeding, it is recommended that the drill be calibrated for the desired seed at the time of planting.

## Introduction

This manual is your guide to drill adjustments for achieving specific seed populations. It covers seeding rates for:

- the standard Main Seed Box (page 2), and
- the optional Small Seeds Attachment (page 33).

Although some setup, operation and adjustment material herein is repeated from the drill Operator Manual, you need to be thoroughly familiar with drill operations and adjustments before applying this Seed Rate manual and its table data.

### Models Covered

This rate manual applies to Great Plains drill models:

3P500-0775	7-Row 7.5 in. (19.1 cm)
3P500-0906	9-Row 6 in. (15.2 cm)
3P500V-0775	7-Row 7.5 in. (19.1 cm)
3P500V-0872	8-Row 7.25 in. (18.4 cm)
3P500V-0906	9-Row 6 in. (15.2 cm)
3P600-0975	9-Row 7.5 in. (19.1 cm)
3P600-1106	11-Row 6 in. (15.2 cm)

### Document Family

# Main Box Seed Rate

Accurately obtaining the desired seed population requires four steps:

1. Setting Drive Type gearbox (from chart)
2. Setting initial Seed Rate Handle (from chart)
3. Positioning Seed Cup Door (by seed type)
4. Calibration: checking predicted seeding rate

Seed rate charts begin on page 7. The charts list proper Drive Type and seed rate handle settings for various seeds and seeding rates.

The seed rate charts are based on cleaned, untreated seed of average size and test weight. The charts are based on factory-supplied new 5.70L x 8 tires, inflated to factory specification. Many factors affect seeding rates including foreign material, seed treatment, seed size, seed weight, field conditions, tire pressure and test weight.

Use the charts only as a starting point. Minor adjustments are commonly required. Set and check the seeding rate using the procedures beginning on page 5, then readjust the rate as necessary.

## Setting Drive Type

Refer to Figure 3

The charts list Drive Types as 1, 2, 3 or 4. Drive Type is determined by the handle ① on the gearbox cover at left front of the drill. Move the handle until the Drive Type number appears in the handle window ②.

For correct Drive Type, refer to the charts in the Seed Rate manual. Each Drive Type corresponds to a specific gear ratio.

Drive Type	Relative Speed
1	Slowest
2	2.06 times faster than Type 1
3	3.08 times faster than Type 1
4	5.02 times faster than Type 1

32790

Note: Drive Type affects both Main Box and optional Native Grass seed rates.

Figure 3  
Gearbox Handle Adjustment

18476

## Main Box Seed Rate Handle

### Refer to Figure 4

There is a single main seed box rate handle for the entire drill.

The seed rate handle controls the percent engagement of the seed sprocket in each seed cup. The initial setting of the handle is given by the Seed Rate Chart.

Note: You can temporarily stop main seed flow (such as for adjusting level/depth) with handle set to zero.

To set the handle:

1. Loosen wing nut ① under handle.
2. Move indicator ② from current setting to about 10 higher than the new desired value from calibration or the Seed Rate Chart, then back to the desired value.
3. Tighten wing nut.

Figure 4  
Main Box Seed Rate Handle

32792

## Position Seed Cup Doors

### Refer to Figure 5, which depicts the seed cup door handle in position ③.

At each main seed box seed tube, adjust the seed cup door handle ④ for the seed size.

The handle has three normal operating position detents:

- ① (top detent) is for the smallest seeds. Use it for wheat and similar small seeds.
- ② (middle detent) is for larger seeds. Use it for soybeans and similar larger seeds.
- ③ (bottom detent) is for oversize or fragile seeds. If you experience excessive cracking with setting ②, use setting ③.

Note: Handle position ⑤ is used for clean-out, not planting. If set to this position with seed loaded, it may be difficult to reset it to a normal operating position.

Figure 5  
Seed Cup Door Handle

26211

## Main Seed Row Shutoff

If alternate row spacings are desired, the unused rows can be shut off with optional plugs.

1. Clean-out seed. The seed box must be empty prior to inserting plugs. See “Main Box Clean-Out” in Operator manual.

### Refer to Figure 6

2. Insert one plug at each row to shut off. Verify the seed hose path before inserting the plug, as some hoses do not make a strictly vertical drop to their row units.
3. Review seed rate settings prior to planting. Perform calibration calculations with the actual active row count.

Figure 6  
Seed Cup Plug

26279

## Reading a Seed Rate Chart

### NOTICE

These charts are estimations of maximum seed rates. Actual results will vary based on conditions and machine maintenance. Maintain your machine regularly for optimum performance.

- Find your seed. Charts are in alphabetical order by common North American seed name. Scientific names are provided. Charts covering more than one seed may be out of order. For Sudan, see Flax.

The example presumes you desire to plant:  
*Barley at 60 pounds per acre with a 7.5 in. drill.*

There are multiple chart sections for some seeds, and the rates may overlap. Use the chart where your desired rate is closest to 50 on the Seed Rate Handle scale.

In our example, that would be Barley Drive Type 2.

If your seed is not listed, find one with similar size, shape and density. Density of the test seed used to develop the chart appears under the right end of the handle scale values.

- Note the Drive Type for the chart rate row chosen (at left above rates). This number (1-4) is used to determine the gearbox handle setting. See page 2.

In the example, this is  
*Drive Type 2*

- Find your row spacing in the far left column.
- Locate your desired seed rate in the table row for your row spacing.

In the example the rate closest to 60 is:  
*64*

- Note the Seed Rate Handle setting required, at the top of the column at that seed rate. This is the initial value set on the Seed Rate Handle. See page 3.

In the example, start with a handle setting of:  
*50 (or interpolate to 47),*  
 and calibrate. When a target rate falls halfway between handle settings, you can adjust the handle slightly to compensate, as in the example, but calibration is apt to result in further adjustment anyway.

Seed Box, continued...

### Main Box Seed Rate Calibration

Differences will exist between the tested seed and field conditions used to generate the Seed Rate Charts, and your seed and conditions. To accurately achieve your target population, Great Plains recommends calibrating.

Due to the large number of crank revolutions per acre (786 or 982) and per hectare (1942 or 2427), a practical calibration is a simulation of  $\frac{1}{10}$ <sup>th</sup> acre or  $\frac{1}{10}$ <sup>th</sup> hectare.

1. Estimate the sample sizes.

$$RateSample = \frac{FieldRate}{10}$$

$$SamplePerRow = \frac{RateSample}{RowCount}$$

$$ExpectedSample = SamplePerRow \times SampledRows$$

2. To perform this calibration, you need a scale that is accurate at the aggregate sample size, and three (3) light containers, each capable of holding the expected *SamplePerRow*. Record the empty container weights.
3. Raise the drill so the gauge wheel is just out of ground contact.
4. Remove the calibration crank from its storage stob. Store the retaining pin on the stob.

Note: On older drills lacking a calibration crank, you can crank the gearbox input jackshaft, by means of a wrench or socket, for the same number of rotations as shown for “Crank” in the table. You can alternatively rotate the gauge wheel tire. A calibration crank upgrade kit is available (see Operator manual 118-794M).

**Refer to Figure 7**

5. Place the hex socket of the crank on the left end of the main jackshaft.
6. Pull the seed hoses off the top of three opener seed tubes, at the top of the openers. Place the hoses into each sample container.

Example: You want to apply barley at 60 pounds per acre with a 3P600 7.5 inch drill. *RateSample* is:

$$6.0 = \frac{60}{10}$$

Example: the drill has 9 rows. *SamplePerRow* is:

$$0.67 = \frac{6.0}{9}$$

Example: 3 rows are to be used in the sampling. *ExpectedSample* is:

$$2.0 = 0.67 \times 3$$

The expected sample weight is 2.0 lb.

Example: 3 containers, each weighing 0.5lb:

$$ContainerWeight = 1.5 \text{ lb}$$

Figure 7 32793  
Calibration Crank

#### Calibration Revolutions

Drill Model	Rotations Per ...				
	3P500	Acre	$\frac{1}{10}$ <sup>th</sup> ac.	Hectare	$\frac{1}{10}$ <sup>th</sup> ha
Crank	982	98.2	2427	243	
Tire	1752	175	4329	433	

Drill Model	Rotations Per ...				
	3P500V	Acre	$\frac{1}{10}$ <sup>th</sup> ac.	Hectare	$\frac{1}{10}$ <sup>th</sup> ha
Crank	982	98.2	2427	243	
Tire	1752	175	4329	433	

Drill Model	Rotations Per ...				
	3P600	Acre	$\frac{1}{10}$ <sup>th</sup> ac.	Hectare	$\frac{1}{10}$ <sup>th</sup> ha
Crank	786	78.6	1942	194	
Tire	1402	140	3464	346	

32366

7. If not already done, set the Drive Type, Seed Rate Handle and Seed Cup Doors across the drill. If any optional seed boxes are loaded, disconnect their drive or set their rate to zero (unless you are simultaneously calibrating multiple boxes).
8. Load seed above the rows to be sampled. Load well more than the expected sample size.
9. Rotate the crank several turns to ensure that the drives and seed cups are engaged, working properly, free from foreign material, and that seed is flowing steadily from the meters. Stop.
10. Note the current reading of the acremeter, unless removed or you do not plan to rely on it for the calibration.
11. Empty the sample containers back into the seed box, and place them back under the three hoses to gather metered seed.
12. Turn crank at a steady rate until one tenth acre or hectare is tallied on acremeter (or count rotations based on the table on page 5). While turning, check that cups have ample seed coming into them.
13. Weigh metered seed. Subtract initial weight of container(s).  
$$NetWeight = GrossWeight - ContainerWeight$$
14. Divide the net seed weight by three. Multiply by number of openers on your drill, and then by ten, to determine the total of pounds per acre seeded.  
$$MeasuredRate = \frac{NetWeight}{3} \times OpenerCount \times 10$$
15. The Seed Rate Handle scale is a percentage of meter opening, and its effect is linear near scale center. Calculate a new scale setting based on the test.  
Set the Seed Rate Handle to the new scale setting.  
$$NewScale = \frac{TargetRate}{MeasuredRate} \times PreviousScale$$
16. You may want to repeat calibration procedure at the new setting if your results varied greatly from the Seed Rate Chart, or if you must operate near the ends of the Seed Rate handle scale (0-20 or 90-100).
17. With calibration complete, store calibration crank, re-engage hub if locked-out, reinstall any removed chains or sprockets, reconnect seed hoses and re-install acremeter (if removed - tighten only to snug).

Example: you desire to plant barley at:  
*60 pounds per acre*  
which is between  
*45 and 50*  
on the Drive Type 2 chart.  
Use an initial Seed Rate Handle (*InitialHandle*) scale setting of:  
*48*

3P600 crank rotations for one tenth acre:  
*78.6*

Example: the containers weighed a total of 3.23 pounds after test:  
*1.73 lbs net*  
$$1.73 = 3.23 - 1.5$$

Example: *MeasuredRate* is:  
*52 lbs/ac*  
$$52 = \frac{1.73}{3} \times 9 \times 10$$

Example:  
the target rate was 60 lbs/ac, and the initial scale 48:  
the new scale setting is:  
*55*  
$$55 = \frac{60}{52} \times 48$$

18. Check that your tire(s) is(are) properly inflated. See “**Tire Inflation Chart**” in Operator manual.  
When drilling, check seeding rate by noting acres drilled, amount of seed added to drill and seed level in drill box. If you are seeding more or less than desired, adjust rate slightly to compensate for field conditions.

## Rate Charts, Main Seed Box

Charts in U.S. customary units.  
Metric charts begin on page 38.

## Small Seeds Rate

Seeding rate from the optional Small Seeds Attachment is controlled entirely by the seed rate handle on the small seeds box. No sprocket changes are required, and small seeds rate is unaffected by settings for main seed box and optional Native Grass.

### Refer to Figure 8

To set Small Seeds rate, loosen the wing nut ① at the handle. Move the lever ② until the indicator is about 10 higher than the intended setting, then return it to that setting. Tighten nut.

Set the initial rate based on the charts starting on page 36.

Figure 8  
Small Seeds Rate Handle

32634

## Small Seeds Rate Calibration

Differences will exist between the tested seed and field conditions used to generate the Small Seeds Rate Charts, and your seed and conditions. To accurately achieve your target population, Great Plains recommends calibrating.

Due to the large number of crank revolutions per acre (786 or 982) and per hectare (1942 or 2427), a practical calibration is a simulation of  $\frac{1}{10}$ <sup>th</sup> acre or  $\frac{1}{10}$ <sup>th</sup> hectare.

1. Estimate the sample sizes.

$$\text{RateSample} = \frac{\text{FieldRate}}{10}$$

$$\text{SamplePerRow} = \frac{\text{RateSample}}{\text{RowCount}}$$

$$\text{ExpectedSample} = \text{SamplePerRow} \times \text{SampledRows}$$

2. To perform this calibration, you need a scale that is accurate near the aggregate sample size, and three (3) light weight containers, each capable of holding a row's sample.
3. Raise the drill so the gauge wheel is out of ground contact.
4. Remove the calibration crank from its storage stob. Store the retaining pin on the stob.

**Note:** On older drills lacking a calibration crank, you can crank the gearbox input jackshaft, by means of a wrench or socket, for the same number of rotations as shown for "Crank" in the table. You can alternatively rotate the gauge wheel tire. A calibration crank upgrade kit is available (see Operator manual 118-794M).

Example: You want to apply alfalfa at 12 pounds per acre with a 3P600 7.5 in. drill. *RateSample* is:

$$1.2 = \frac{12}{10}$$

Example: the drill has 9 rows.

*SamplePerRow* is:

$$0.133 = \frac{1.2}{9}$$

Example: 3 rows are to be used in the sampling. *ExpectedSample* is:

$$0.40 = 0.133 \times 3$$

The expected sample weight is 0.4 lb.

Example: 3 containers each weighing 0.23 lb or:  
*0.70 lb total*

**Refer to Figure 9**

5. Place the hex socket of the crank on the left end of the main jackshaft.
6. Pull the small seed hoses off the top of three opener seed tubes, at the top of the openers. Place the hoses into each sample container.

Figure 9  
Calibration Crank 32793

7. If not already done, set the Small Seeds Rate Handle.
8. Load seed above the rows to be sampled. Load well more than the expected sample size.
9. Rotate the crank several turns to ensure that the drives and seed cups are engaged, working properly, free from foreign material, and that seed is flowing steadily from the meters. Stop.
10. Note the current reading of the acremeter, unless removed or you do not plan to rely on it for the calibration.
11. Empty the sample containers back into the seed box, and place them back under the three hoses to gather metered seed.
12. Turn crank at a steady rate until one tenth acre is tallied on acremeter, or for the number of rotations from the table at right. While turning, check that cups have ample seed coming into them.

Example: on the 3P600 7.5 in. drill, planting alfalfa at 12 pounds/ac has an initial small seeds rate handle setting of:  
60

**Calibration Revolutions**

Drill Model	Rotations Per ...			
	Acre	1/10 <sup>th</sup> ac.	Hectare	1/10 <sup>th</sup> ha
<b>3P500</b>				
Crank	982	98.2	2427	243
Tire	1752	175	4329	433

Drill Model	Rotations Per ...			
	Acre	1/10 <sup>th</sup> ac.	Hectare	1/10 <sup>th</sup> ha
<b>3P500V</b>				
Crank	982	98.2	2427	243
Tire	1752	175	4329	433

Drill Model	Rotations Per ...			
	Acre	1/10 <sup>th</sup> ac.	Hectare	1/10 <sup>th</sup> ha
<b>3P600</b>				
Crank	786	78.6	1942	194
Tire	1402	140	3464	346

32366

13. Weigh metered material. Subtract initial weight of container(s).

$$NetWeight = GrossWeight - ContainerWeights$$

Example:  
the three containers weighed a total of 1.13 pounds after test: 0.43 lbs net

$$0.43 = 1.13 - 0.70$$

14. Divide the net material weight by three. Multiply by number of openers on your drill, and then by ten, to determine the total of pounds per acre applied.

$$MeasuredRate = \frac{NetWeight}{3} \times RowCount \times 10$$

Example: 10.0 lbs/ac

$$12.8 = \frac{0.43}{3} \times 9 \times 10$$

15. Divide the desired original field rate by the measured rate to calculate a scale adjustment factor.

$$\text{CorrectionFactor} = \frac{\text{FieldRate}}{\text{MeasuredRate}}$$

16. Multiply the scale setting just used times correction factor to obtain the next scale setting to use.

$$\text{NextScale} = \text{PreviousScale} \times \text{CorrectionFactor}$$

17. Set the Small Seeds Rate Handle to the new scale setting.
18. You may want to repeat calibration procedure at the new setting if your results varied greatly from the Seed Rate Chart, or if you must operate near the ends of the Seed Rate handle scale (0-20 or 90-100).
19. Check that your tire(s) is (are) properly inflated. See **“Tire Inflation Chart”** in Operator manual.
20. With calibration complete, store calibration crank, re-engage hub if locked-out, reinstall any removed chains or sprockets, reconnect seed hoses and re-install acremeter (if removed - tighten only to snug).

When drilling, check seeding rate by noting acres drilled, amount of seed added to drill and seed level in drill box. If you are seeding more or less than desired, adjust rate slightly to compensate for field conditions.

### Small Seeds Row Shut-Off

If alternate row spacing is required for small seeds, optional plugs are available to block flow inside the seed box tray.

1. Clean-out seed. The seed box must be empty prior to inserting plugs. See **“Small Seeds Box Clean-Out”** in Operator manual.
2. Before installing plugs, inspect the seed boxes for existing factory-installed plugs. These are blocking extra unused seed ports. You may want to identify these plugs with an indelible marker.
3. Insert one plug at each row to shut off. Verify the seed hose path before inserting the plug, as some hoses do not make a strictly vertical drop to their row units.
4. Review seed rate settings prior to planting. Perform calibration calculations with the actual active row count.

When removing plugs to restore rows to operation, be sure to not disturb a factory-installed plug.

Example: the target rate was 12 lbs/ac:  
the correction factor =1.2

$$0.94 = \frac{12}{12.8}$$

Example: the previous scale setting was 60,  
the next scale setting is 56

$$56 = 60 \times 0.94$$

Figure 10  
Small Seeds Tube Plug
